Neurogenic Disorders Of Language Theory Driven Clinical Practice

Frontiers | The Role of Gesture in Communication and Language

Anatomical Overview. Nociception is the process by which intense thermal, mechanical or chemical stimuli are detected by a subpopulation of peripheral nerve fibers, called nociceptors (Basbaum and Jessell, 2000). The cell bodies of nociceptors are located in the dorsal root ganglia (DRG) for the body and the trigeminal ganglion for the face, and have both a peripheral and central neural branch.

Adapting a Patient-Reported Outcome Bookmarking Task to be Used in a Neuropsychological Assessment. The purpose of this task is to provide a measure of a patient’s fear-avoidance beliefs about physical activity, and the specific health-related behavior they believe will prevent injury.

Likewise, the functions of gesture have been explored to a much more limited degree in individuals with acquired neurologic communication disorders. Yet, the study of gesture in such populations provides a key opportunity to establish, and test, neurobiological models of co-speech gesture.

Stuttering - Wikipedia

Stuttering, also known as stammering, is a speech disorder in which the flow of speech is disrupted by involuntary sound repetitions and prolongations of sounds, syllables, words, or phrases as well as involuntary silent pauses or blocks in which the person who stutters is unable to produce sounds. The term stuttering is most commonly associated with involuntary sound repetition, but also

Surgical complications: Renal

Medications as an adjunctive therapy to immobilization have been gaining popularity over the last several years, starting with the bisphosphonates. These drugs have shown that with even a single dose administration of bisphosphonates clinical and radiologic improvements may be observed in bone density and strength.
